Marine ecosystem. Marine ecosystems are among the largest of Earth 's aquatic ecosystems. Examples include salt marshes, intertidal zones, estuaries, lagoons, mangroves, coral reefs, the deep sea, and the sea floor. They can be contrasted with freshwater ecosystems, which have a lower salt content.

of the dynamics of marine populations. Evidence for this assumption has been the theme of the two previous editions of this book. However, recent develop-ments have drawn attention to the part played by the properties of the organisms themselves, and of the biological communities, in modifying the outcomes of physical–biological interactions.

In view of the current concern about the role of oceans in climate change, and the management of fish stocks, there is an increasing need to integrate biological, chemical, and physical processes to understand completely how marine ecosystems function.

marine ecosystems are reviewed: bottom-up control (control by primary producers), top-down control (control by predators) and wasp-waist control (control by dominant species). Answers to the questions depend on the different energy flow mechanisms assumed to operate. No general theory can be ascribed to the functioning of marine ecosystems.

THE FUNCTIONING OF MARINE ECOSYSTEMS

GLOBEC studies focused on biological—physical interactions of target species in different study regions, emphasizing responses of organisms to varying physical forces. Population?level processes were shown to be important, with ecological responses often being ecosystem?specific. The timing of biological events (e.g. spring bloom, entry/exit from diapause, and fish spawning) is ...
