DEFINITION OF KEY TERMS Active earth pressure coefficient (K_a): It is the ratio of horizontal and vertical principal effective stresses when a retaining wall moves away (by a small amount) from the retained soil. Passive earth pressure coefficient (K_p): It is the ratio of horizontal and vertical principal effective stresses when a retaining wall is forced against a soil mass. Coefficient of ...

The initial lateral earth pressure of soils in nature have an in-situ state of stress commonly referred to as "At-rest" conditions (typically referred to as K_0). The design of a retaining wall requires that lateral earth pressures are properly calculated. In this effort various engineers and researchers have proposed a number of

Lateral earth pressure is the pressure that soil exerts in the horizontal direction. The lateral earth pressure is important because it affects the consolidation behavior and strength of the soil and because it is considered in the design of geotechnical engineering structures such as retaining walls, basements, tunnels, deep foundations and braced excavations.
