The theory of continental drift suggests that the continents drift across the ocean and are not stationary on earth's surface. Alfred Wegener proposed that all of the continents on Earth were once fitted together into a single super continent that he named, "Urkontinent".

Continental Drift | Earth Science

The continental drift hypothesis was developed in the early part of the 20 th century, mostly by Alfred Wegener. Wegener said that continents move around on Earth's surface and that they were once joined together as a single supercontinent.

Wegener's ideas about continental drift were not widely accepted during his lifetime. He suggested that the earth's spinning on its axis caused the continents to move and to plow through the ocean floor, and many geologists of the time were not convinced by this explanation of the mechanism of continental drift. They countered that the

In 1915, Alfred Wegener proposed that all of Earth's continents were once joined in an ancient supercontinent he called Pangaea. Wegener's idea of moving continents led to the modern theory of plate tectonics. Create your own version of Pangaea by fitting Earth's landmasses together like puzzle pieces. Use evidence from fossils, rocks, and glaciers to refine your map.

Continental drift was a theory that explained how continents shift position on Earth's surface. Set forth in 1912 by Alfred Wegener, a geophysicist and meteorologist, continental drift also explained why look-alike animal and plant fossils, and similar rock formations, are found on different continents and why many of the continents appear to fit together like puzzle pieces into one super-continent called Pangaea .
