Phase transitions of the pore fluid were also observed for krypton in MCM-48 silica materials at 87 K, which is 26.5 K below the bulk triple point [13]. Remarkably, the width of the hysteresis loop decreases with decreasing pore size, which may indicate that at 87 K the pore fluid of C is much closer to pore criticality as the confined fluid in A (in case the observed phase transitions for ...

Phase transformations of elements under high pressure

Sublimation is the transition of a substance directly from the solid to the gas state, without passing through the liquid state. Sublimation is an endothermic process that occurs at temperatures and pressures below a substance's triple point in its phase diagram, which corresponds to the lowest pressure at which the substance can exist as a liquid.

Phase Change or Phase Transition - Definition & Examples

Matter undergoes phase changes or phase transitions from one state of matter to another. Below is a complete list of the names of these phase changes. The most commonly known phase changes are those six between solids, liquids, and gasses. However, plasma also is a state of matter, so a complete list requires all eight total phase changes.

Phase transition (or phase change) is the transition between solid, liquid, and gaseous states of matter, as well as plasma in rare cases. A phase of a thermodynamic system and the states of matter have uniform physical properties. During a phase transition of a given medium, certain properties of the medium change, often discontinuously, as a result of the change of external conditions,

Phase transition - Wikipedia

Condensation is the process by which, the physical state of a substance changes from its gas phase to the liquid phase. It can also be defined as the transition of water vapour into water droplets, upon contacting a solid surface. This process is useful in separating a solute and solvent from its solution.
