The most thoroughly studied figures of equilibrium for a homogeneous incompressible rotating liquid are ellipsoidal: ellipsoids of rotation and triaxial ellipsoids. The families of surfaces formed by these figures of equilibrium constitute "linear" sequences that are continuously dependent on the magnitude of the angular velocity ω , which varies between zero and a value less than $\bar{\omega}$.

The Jacobi and Dedekind ellipsoids are both equilibrium figures for a body of rotating homogeneous self-gravitating fluid. However, while the Jacobi ellipsoid spins bodily, with no internal flow of the fluid in the rotating frame, the Dedekind ellipsoid maintains a fixed orientation, with the constituent fluid circulating within it.

The results of Chandrasekhar (1969) are generalized to polytropes, using a formalism based on ellipsoidal energy variational principle to construct approximate stellar equilibrium solutions and study their stability. After reviewing the energy variational method and describing the approach, several equivalent stability conditions are established and secular vs. dynamical instabilities are ...
