1. Introduction. Although the nature of interaction remains uncertain, studies showed that an apparently true biological association exists between Plasmodium and helminths when they coexist in a host [1, 2].Hence, the presence of helminth can affect the risk of malaria and severity of the disease; or the occurrence of Plasmodium infection may in turn impact the upcoming helminth infections ...

The nature and consequences of coinfection in humans
Understanding the impact of helminth infections on clinical malaria is useful for designing effective malaria control strategies. Plenty of epidemiological studies have been conducted to unravel the nature of interactions between Plasmodium and helminth infection. Careful broad summarization of the existing literature suggests that > Schistosoma mansoni</i> and hookworm infections may increase ...

Coinfection - Wikipedia
Coinfection with helminths affects around 800 million people worldwide. Coinfection is of particular human health importance because pathogen species can interact within the host. The net effect of coinfection on human health is thought to be negative. Interactions can have either positive or negative effects on other parasites.

Reviews of coinfection have emphasised that coinfection requires further research, especially in humans,2,3,20,22 where coinfection outnumbers single infection in many communities2,23 and where helminth coinfections appear to worsen human health.20 Coinfection involves a range of pathogens and can have various effects on coinfecting hosts.3 There are many individual studies concerning ...

Global epidemiology. GI parasites are infectious diseases of poverty. Thus, while still found in North America and Europe, their prevalence is highest in areas of intense poverty in low- and middle-income countries in the tropical and subtropical regions of SSA, Asia and LAC [2,3,22-26].In North America and Europe, these infections are most prevalent within immigrant and refugee communities ...

Coinfection is the simultaneous infection of a host by multiple pathogen species.In virology, coinfection includes simultaneous infection of a single cell by two or more virus particles. An example is the coinfection of liver cells with hepatitis B virus and hepatitis D virus, which can arise incrementally by initial infection followed by superinfection. ...

We examine coinfection between helminth species and the bacterium Leptospira interrogans in a natural population of the Norway rat, Rattus norvegicus.We ask whether coinfection can influence the probability and intensity of infection of these enzootic and zoonotic parasites in urban rats, which may affect the loads of parasites excreted into the environment.
