Flash evaporation of a single-component liquid. This type of flash evaporation is used in the desalination of brackish water or ocean water. Stage Flash Distillation.". The water is heated and then routed into a reduced-pressure flash evaporation "stage" where some of the water is turned into steam.

Separation process principles. Seader and Henley stress the viewpoint of unifying the rate-based approach and the equilibrium-based approach in a course that systematically proceeds through the separation operations after initial chapters on the fundamentals of diffusion and mass transfer and on physical equilibrium (Ch. 2).

Theoretical plate - Wikipedia

Equilibrium separation processes are usually operated in a counter current configuration in which the two zones are made to flow opposite to each other in a closed vessel (or column). To ensure good contact, the column is either equipped with trays or filled with packing.

Equilibrium Stage Operations. Equilibrium stage operations are based on principles of phase equilibrium. Two phases are mixed together. The components will partition between the phases as the system tries to reach equilibrium.

A theoretical plate in many separation processes is a hypothetical zone or stage in which two phases, such as the liquid and vapor phases of a substance, establish an equilibrium with each other. Such equilibrium stages may also be referred to as an equilibrium stage, ideal stage, or theoretical tray. The performance of many separation processes depends on having series of equilibrium stages and is enhanced by providing such stages.

The separation processes we are studying in Chapters 1 to 14 are based on the equilibrium stage concept, which states that streams in contact reach equilibrium.

Flash distillation (sometimes called "equilibrium distillation") is a single stage separation technique. A liquid mixture feed is pumped through a reboiler to raise the temperature and enthalpy of the mixture. It then flows through a valve and the pressure is reduced, causing the liquid to p

Representative equilibrium stage. 1.4 The Equilibrium-Stage Concept The intraphase mass transfer operations of Table 1.4 are inherently equilibrium operations. Thus the maximum attainable degree of separation cannot be predicted from thermodynamic properties of the species. In interphase operations in Table 1.1, however, the phases are brought into contact in stages.
