Linear Programming - SlideShare

The use of constraints had its scientific and commercial breakthrough in the 1990s. Programming with constraints makes it possible to model and specify problems with uncertain, incomplete information and to solve combinatorial problems, as they are abundant in industry and commerce, such as scheduling, planning, transportation, resource allocation, layout, design, and analysis.

PROPERTIES OF LINEAR PROGRAMMING MODEL
The following properties form the linear programming model:
Relationship among decision variables must be linear in nature.
A model must have an objective function.
Resource constraints are essential.
A model must have a non-negativity constraint.

The theoretically well-founded presentation includes application examples from real life. It introduces the common classes of constraint programming languages and constraint systems in a uniform way. Constraint solving algorithms are specified and implemented in the constraint handling rules language (CHR).

It would not be a complete first look-report if there wasn't any comment about the support of Element in the tested CP system (see for example Learning constraint programming - part II: Modeling with the Element constraint). In one way, how Element is supported can be seen as a proxy of the "expressiveness" of a CP system and its host language.

Constraint Processing - 1st Edition

Constraint logic programming is a form of constraint programming, in which logic programming is extended to include concepts from constraint satisfaction. A constraint logic program is a logic program that contains constraints in the body of clauses. An example of a clause including a constraint is $A(X, Y) :- X + Y > 0, B(X), C(Y)$. In this clause, $X + Y > 0$ is a constraint; $A(X, Y)$, $B(X)$, and C ...
