Internal combustion engine - Wikipedia

External combustion engines therefore require a heat exchanger, or boiler to take in heat, and as their fuels are burnt externally under steady conditions, they can in principle use any fuel that can burn, including agricultural residues or waste materials There are two main families of external combustion engines; steam engines which rely

External Combustion Engine | stirlingkit

Internal and external combustion engines are two types of heat engines: they convert thermal energy into mechanical energy. The main difference between internal and external combustion engine is that in internal combustion engines, the working fluid burns inside the cylinder, whereas in external combustion engines, combustion takes place outside the cylinder and heat is then transferred to the working fluid.

External Combustion Engine

An external combustion engine (EC engine) is a heat engine where a working fluid, contained internally, is heated by combustion in an external source, through the engine wall or a heat exchanger. The fluid then, by expanding and acting on the mechanism of the engine, produces motion and usable work.

The external combustion engine, then, is an engine that's designed with external heating and cooling functions in order to work. It sounds kind of impractical, but it's actually quite efficient. And at least two distinct types of external combustion engines have been used in cars: the steam engine and the Stirling engine.

4.5 EXTERNAL COMBUSTION ENGINES

An external combustion engine is a heat engine where an (internal) working fluid is compressed and heated by combustion of an external fuel through the engine wall or a heat exchanger. The fluid then, by expanding and acting on the mechanism of the engine (piston or turbine), produces a shaft power.

Fuels and oxidizers. All internal combustion engines depend on combustion of a chemical fuel, typically with oxygen from the air (though it is possible to inject nitrous oxide to do more of the same thing and gain a power boost). The combustion process typically results in the production of a great quantity of heat,...

External combustion engine - Wikipedia

External Combustion Engine Meaning. An external combustion engine uses a working fluid, either a liquid or a gas or both, that is heated by a fuel burned outside the engine. The external combustion chamber is filled with a fuel and air mixture that is ignited to produce a large amount of heat.

External Combustion Engine | Definition of External ...

External combustion engines separate the combustion process (which is the energy input to the engine) from the working gas, which undergoes pressure fluctuations and hence does useful work. As the combustion process is used to provide a continuous heat input to the working gas, it is more controllable and potentially more efficient, cleaner and quieter than internal combustion engines.

External Combustion Engine

An external combustion engine is one in which the oxidation of the fuel occurs outside the engine, which provides heat to the motive portion of the engine.
