A dynamical system is a manifold  $M$  called the phase (or state) space endowed with a family of smooth evolution functions  $\phi_t$  that for any element of  $t \in T$ , the time, map a point of the phase space back into the phase space. The notion of smoothness changes with applications and the type of manifold. There are several choices for the set  $T$ . When  $T$  is taken to be the reals, the dynamical ...

FEEDBACK EXAMPLES 5. Dynamics in the system (parameter errors, unmodeled effects, etc). The algorithm that computes the control action as a function of the sensor values is often called a control law. The system can be influenced externally by an operator who introduces command signals to the system.
