Geopolymers are attractive host materials to immobilise nuclear waste due to their high environmental durability and flexibility to compositional changes of waste. They are already used on industrial scale to immobilise difficult radioactive waste streams in Czech Republic and Slovakia.

Fire Resistance of OPC and Geopolymers | SpringerLink
Fire-safe polymers are polymers that are resistant to degradation at high temperatures. There is need for fire-resistant polymers in the construction of small, enclosed spaces such as skyscrapers, boats, and airplane cabins. In these tight spaces, ability to escape in the event of a fire is crucial.

Most polymers decompose by either an unzipping or a random chain scission mechanism with an endothermic decomposition of 100- 900 J/g. Aromatic or heteroaromatic rings, conjugated double or triple bonds, and heteroatoms such as halogens, N, O, S, P, and Si, are the basic structural features that confer stability to polymers.
