CHAPTER 4 FOURIER SERIES AND INTEGRALS

In mathematics, a Fourier series is a periodic function composed of harmonically related sinusoids, combined by a weighted summation. With appropriate weights, one cycle of the summation can be made to approximate an arbitrary function in that interval. As such, the summation is a synthesis of another function. The discrete-time Fourier transform is an example of Fourier series. The process of deriving the weights that describe a given function is a form of Fourier analysis. For functions on unb

The trigonometric Fourier series can be represented as:
$$f(x) = \frac{a_0}{2} + \sum_{n=1}^{\infty} a_n \cos nx + \sum_{n=1}^{\infty} b_n \sin nx$$
Which is evidently $c-n$ (c_n with n replaced by $-n$). We have combined c_0 with the first summation and replaced the dummy summation index n by $-n$ in the second summation. Where c_n is given by (4).
