### HOW TO SIMULATE PEMFC BY CFD (FLUENT)?

The issues can arise from different sources. Mesh quality is very important, especially in through-plane direction (y direction in default). One important thing that I experience ever which makes the anodic and cathodic current density zero, is the correct modeling of the surface between the flow channels and GDL.

I'm not sure about the fuel cell model, but having a conformal mesh is likely to help. You also need to make sure you have 10+ cells across a flow channel and that the cell quality is good. A wall - wall:shadow pair means you have a thin wall. Ie the wall is a single surface and has cells on both sides.
