Maxwell's equations still provide a complete and elegant description of electromagnetism down to, but not including, the subatomic scale. The interpretation of his work, however, was broadened in the 20th century. Einstein's special relativity theory merged electric and magnetic fields into one common field and limited the velocity of all matter to the velocity of electromagnetic radiation.

Electromagnetic Waves

Electromagnetism is a branch of Physics, that deals with the electromagnetic force that occurs between electrically charged particles. The electromagnetic force is one of the four fundamental forces and exhibits electromagnetic fields such as magnetic fields, electric fields, and light. It is the basic reason electrons bound to the nucleus and responsible for the complete structure of the nucleus.

An electromagnetic wave is a type of wave (a wave carries energy through a medium—though electromagnetic waves seemingly need no medium as they propagate through vacuums) that moves at speed c, or the speed of light (the speed of light is 300,000 km/s in free space). It is composed of two fields, oriented at right angles to each other—the electric field and the magnetic field.

Charge comes in 2 types, positive and negative and is measured in Coulombs (C). If you have a charge on its own it emits a field in all directions. The field from a charge is represented by E as in Electricity. If you put another charge in the field it experiences a force. Like charges repel and unlike charges attract.
