*The unit kJ/kg-K is equivalent to kPa-m³/kg-K. The gas constant is calculated from R = U/M, where R = 8.31447 kJ/kmol-K is the universal gas constant and M is the molar mass. Source: Specific heat values are obtained primarily from the property routines prepared by The National Institute of Standards and Technology (NIST), Gaithersburg, MD.

The specific heat capacity (c_v) of a substance, commonly called its specific heat, is the quantity of heat required to raise the temperature of 1 gram of a substance by 1 degree Celsius (or 1 kelvin): $c = \frac{q}{m\Delta T}$ Specific heat capacity depends only on the kind of substance absorbing or releasing heat.

Fundamentals Of Heat And M

This bestselling book in the field provides a complete introduction to the physical origins of heat and mass transfer. Noted for its crystal clear presentation and easy-to-follow problem solving methodology, Incropera and Dewitt's systematic approach to the first law develops reader confidence in using this essential tool for thermal analysis.

Vapor Chambers Explained | Benefits and Limitations

Figure 8a-1: The atomic structure of a water (or dihydrogen monoxide) molecule consists of two hydrogen (H) atoms joined to one oxygen (O) atom.The unique way in which the hydrogen atoms are attached to the oxygen atom causes one side of the molecule to have a negative charge and the area in the opposite direction to have a positive charge.

Principles of Electromechanical Energy Conversion

Keep in mind plastic is a poor conductor of heat. The heat from the plastic radiates relatively slowly into the mold steel. The heat-transfer characteristics of the mold steel and the water in the cooling lines are many times faster. The weak link in this plastic-metal-water heat-transfer system is the water's flow rate.

PROPERTY TABLES AND CHARTS (SI UNITS)

Standard heat pipes only transfer heat along the axis of the heat pipe, so they are best suited to cooling discrete heat sources. Vapor Chambers or High Conductivity (HIK™) Plates are used to collect heat from larger area sources, and either spread the heat, or conduct it to a cold rail for cooling. Vapor Chambers are generally used for high heat flux applications, or when genuine two ...
