For RGB images, it would be $N \times M \times 3$. Consider an RGB image with size 30×30 . This would require 2700 neurons. An RGB image of size 256×256 would require over 100000 neurons. ANN takes a vector of inputs and gives a product as a vector from another hidden layer that is fully connected to the input.

VECTOR NETWORK ANALYZER FUNDAMENTALS

A Vector Network Analyzer contains both a source, used to generate a known stimulus
signal, and a set of receivers, used to determine changes to this stimulus caused by the
device-under-test or DUT. The stimulus signal is injected into the DUT and the Vector
Network Analyzer measures both the signal that's reflected from the input side, as well
