General relativity (GR), also known as the general theory of relativity or (GTR), is the geometric theory of gravitation published by Albert Einstein in 1915 and the current description of gravitation in modern physics. General relativity generalizes special relativity and refines Newton's law of universal gravitation, providing a unified description of gravity as a geometric property of space ...

the essential differential geometry as an extension of vector calculus. Our treatment is closer to that Wald (1984) and closer still to Misner, Thorne and Wheeler (1973). These books are rather advanced. For the newcomer to general relativity we warmly recommend Schutz (1985). Our notation and presentation is patterned largely after Schutz.

"General relativity without tensors"

The metric tensor is a central object in general relativity that describes the local geometry of spacetime (as a result of solving the Einstein field equations). Using the weak-field approximation, the metric can also be thought of as representing the 'gravitational potential'.
