In general, viruses that cause localized infections have short incubation periods (<7 days), while in disseminated infections, the incubation period tends to be longer. Both viral and host factors contribute to clinical disease during the course of a viral infection. Host immune cells release interferons and other cytokines which induce the symptoms of fever and malaise.

Virology Lecture Note. They are much smaller than the smallest genomes of viruses and have no genes for encoding proteins. After invading a host cell, viroids are thought to mimic the cell's DNA, so that the cell's RNA polymerase replicates them in the nucleus. Viroids are believed to cause disease by interfering with the host cell's gene regulation.
