Genetic changes in human populations occur too slowly to be responsible for the obesity epidemic. Nevertheless, the variation in how people respond to the same environment suggests that genes do play a role in the development of obesity. How Could Genes Influence Obesity?***

Abstract Numerous classical genetic studies have proved that genes are contributory factors for obesity. Genes are directly responsible for obesity associated disorders such as Bardet–Biedl and...

Genes Are Not Destiny | Obesity Prevention Source ...

Some genetic changes that promote obesity also elevate risk of high cholesterol, cardiovascular disease, and diabetes—but not equally so. Two people with the same BMI may have different underlying causes of obesity and in turn different risks of developing metabolic diseases.

Genetic & epigenetic approach to human obesity

Candidate gene and genome-wide association studies have led to the discovery of nine loci involved in Mendelian forms of obesity and 58 loci contributing to polygenic obesity. These loci explain a small fraction of the heritability for obesity and many genes remain to be discovered.

Obesity: When Is It Genetic?

Genes influence every aspect of human physiology, development, and adaptation. Obesity is no exception. Yet relatively little is known regarding the specific genes that contribute to obesity and the scale of so-called “genetic environment interactions” the complex interplay between our genetic makeup and our life experiences.

Genetics of Childhood Obesity

The good news is that obesity is not solely due to genetics. It's a condition that can usually be managed with lifestyle changes. Even when a genetic predisposition to obesity exists, HSPH notes...

Genes and obesity | CDC

Obesity is highly heritable and arises from the interplay of multiple genes and environmental factors. Recent advancements in Genome-wide association studies (GWAS) have shown important steps towards identifying genetic risks and identification

of genetic markers for lifestyle diseases, especially for a metabolic disorder like obesity.

Nutrition & Obesity Genetics & Genomics | NIDDK

Rarely, obesity occurs in families according to a clear inheritance pattern caused by changes in a single gene. The most commonly implicated gene is MC4R, which encodes the melanocortin 4 receptor. Changes in MC4R that diminish its function are found in a small fraction (< 5%) of obese people in various ethnic groups.

Genetics of obesity - Wikipedia

Genetics There have been several theories put forward by research to best explain the causes obesity and one major potential causes is genetics. Maffeis et al (1998) found that obesity in parents was the strongest predictor of childhood obesity, regardless of diet or level of activity. Furthermore recent research has found support for this claim.

Polymorphisms in various genes controlling appetite and metabolism predispose to obesity under certain dietary conditions. The percentage of obesity that can be

attributed to genetics varies widely, depending on the population examined, from 6% to 85%.
