Introduction. Bees (Apoidea; Anthophila) constitute a monophyletic group of largely pollenivorous species that rely almost exclusively on flowers for their life cycle -. The lineage arose from among the carnivorous apoid wasps in the late Early Cretaceous and contemporaneous with the diversification of eudicots , , -. Indeed, the various families of bees all appear to have originated early ...

The Geological Record of Ocean Acidification

Ecology: Pond sliders are aquatic, omnivorous generalists, which rarely leave water except to bask (Ernst et al., 1994; Brown et al., 1995; Conant and Collins, 1998; Cox et al., 1998). Adult turtles tend to be more herbivorous than juveniles, but both will opportunistically eat aquatic invertebrates (especially insects and mollusks), fish, frog eggs and tadpoles, aquatic snakes, and a wide ...

Geology (from the Ancient Greek γη, gē ("earth") and -λογία, -logia, ("study of", "discourse")) is a branch of Earth science concerned with both the liquid and solid Earth, the rocks of which it is composed, and the processes by which they change over time. Geology can also include the study of the solid features of any terrestrial planet or natural satellite such as Mars or the Moon.

The Dakota is a sedimentary geologic unit name of formation and group rank in Midwestern North America. The Dakota units are generally composed of sandstones, mudstones, clays, and shales deposited in the Mid-Cretaceous opening of the Western Interior Seaway. The usage of the name Dakota for this particular Albian–Cenomanian strata is exceptionally widespread; from British Columbia and Alberta ...

The Geological Time-scale The ideas of superposition and evolution provide the basis of the geological time-scale, which was developed in a somewhat random fashion (mostly in Europe) during the 19th century. It is a worldwide scale developed by correlation of fossils from all around the world. It is based the fossil record discussed above.

The geological record is imprinted with numerous examples of biotic responses to natural perturbations in global carbon cycling and climate change (), some of which could have been caused by large-scale ocean acidification. By reconstructing past changes in marine environmental conditions, we can test hypotheses for the causes and effects of future-relevant stressors such as ocean acidification ...

The USGS Energy Resources Program has studied oil shale resources of the United States, with a significant effort on the Eocene Green River Formation of Colorado, Utah, and Wyoming. This formation contains the largest oil shale deposits in the world. Oil shale, despite the name, does not actually contain oil, but is a precursor of oil that is converted to crude oil when heated.
