Convergent seabed glacial lineations and other subglacially streamlined features eroded in bedrock around the Islands of Canna and Rum preserve the direction of ice sheet movement, and strongly suggest the onset of ice streaming in a southwesterly direction on the continental shelf in the Sea of the Hebrides region.

Geomorphology - Wikipedia

Glacial geomorphology is concerned principally with the role of glacial ice in landform and landscape evolution while periglacial geomorphology is fundamentally concerned with the development of landscapes in cold, nonglacial environments. Unlike the obviously profound impact glacial ice has on landscape evolution,...

A Summary of Geomorphology and Its Processes

Cirques with submerged floors show that during a considerable part of the glacial ages sea level was lower than today. Strand lines up to 1425 feet A.T. indicate very great depression of the land in the late Wisconsin, possibly connected with an increase of ice in the Hudson Strait area as precipitation increased after the disappearance of the topographic barrier of the main Laurentide Ice Sheet.

The geomorphology of an estuarine basin is usually developed by one of three agents: (1) fluvial or glacial erosion, (2) fluvial and marine deposition, or (3) tectonic activity. The last of these involves the downfaulting of a coastal area or the broad local subsidence of a stretch of coastline, as in the case of San Francisco Bay .
