## D3.js - Data-Driven Documents

Model complex multi-entity relationships through the use of a graph-based data model. ... As the transformations listed herein have potentially incompatible interpretations, additional profiling of the JSON format is required to provide a deterministic transformation

The above series of transformations form the DAG (Directed Acyclic Graph) below. This graph, as shown below, demonstrates the lineage, or provenance of the chain of transformations.

## Graph Transformations And Model Driven

Chaining two subsequent transformations means co-locating them within the same thread for better performance. Flink by default chains operators if this is possible (e.g., two subsequent map transformations). The API gives fine-grained control over chaining if desired:

D3 allows you to bind arbitrary data to a Document Object Model (DOM), and then apply data-driven transformations to the document. For example, you can use D3 to generate an HTML table from an array of numbers. Or, use the same data to create an interactive SVG bar chart with smooth transitions and interaction.

Apache Flink is an open-source, unified stream-processing and batch-processing framework developed by the Apache Software Foundation. The core of Apache Flink is a distributed streaming data-flow engine written in Java and Scala. Flink executes arbitrary dataflow programs in a data-parallel and pipelined (hence task parallel) manner. Flink's pipelined runtime system enables the execution of ...

These systems enable data-driven decision making (analytic systems) and drive data-powered products, including with machine learning (operational systems). They range from the pipes that carry

data, to storage solutions that house data, to SQL engines that analyze data, to dashboards that make data easy to understand □ from data science and ...

### Verifiable Credentials Data Model 1.0

In this paper, a new traffic flow model called the forward-backward velocity difference (FBVD) model based on the full velocity difference model is proposed to investigate the backward-looking effect by applying a modified backward optimal velocity using generalized backward maximum speed. The FBVD model belongs to the family of microscopic models that consider spatiotemporally continuous ...
