The total measurement uncertainty of a typical tape is higher due to additional contributing factors, such as the need to make repeatable measurements on the tape's many hash marks. In NIST's tape tunnel, which is over 60 meters long (almost 200 feet), researchers can measure a tape with an accuracy of 0.1 mm, about the thickness of a sheet ...

This crude "measurement" is certainly subject to uncertainty. If pressed, the carpenter might express this uncertainty by admitting that the height could be as little as 205 or as much as 215 cm. If she wanted a more accurate measurement, she would use a tape measure, and she might find that the height is 211.3 cm.
