problems and problems are relative to the context in which they occur. A design problem in OOP is not necessarily one in functional programming (FP), and vice versa. From a Haskell perspective, many (but not all) of the well known "Gang of Four" patterns [Design patterns, Gamma et al.] become so easy to ...

1. Functional Patterns – the Building Blocks - Haskell ...

There is one other kind of pattern allowed in Haskell. It is called a lazy pattern, and has the form `~pat`. Lazy patterns are irrefutable: matching a value `v` against `~pat` always succeeds, regardless of `pat`.

Operationally speaking, if an identifier in `pat` is later "used" on the right-hand-side, it will be bound to that portion of the value that would result if `v` were to successfully match `pat`, and `_|_` otherwise.

Design Patterns. Haskell/FP say "don't do these things," and the resulting applications are a lot smaller/simpler. So for the same set of basic requirements (eg, the essential complexity of the problem domain), the FP solution will be smaller and simpler. It will also require less structure/design-patterns.
