A Cavity-backed Coplanar Waveguide Slot Antenna Array James McKnight ABSTRACT In this paper a cavity-backed slot antenna array is designed for relatively wide instantaneous bandwidth, high gain, and low sidelobes. The array consists of four, rectangular, slot elements, arranged side-by-side in a 1x4 array and developed around 5GHz.

Waveguide (electromagnetism) - Wikipedia

Slot antennas are used typically at frequencies between 300 MHz and 24 GHz. The slot antenna is popular because they can be cut out of whatever surface they are to be mounted on, and have radiation patterns that are roughly omnidirectional (similar to a linear wire antenna, as we'll see). The polarization of the slot antenna is linear.

Slot Antenna

Slot radiators or slot antennas are antennas that are used in the frequency range from about 1 GHz to 25 GHz. They are often used in navigation radar usually as an array fed by a waveguide. But older large phased array antennas used the principle because the slot radiators are a very inexpensive way for frequency scanning arrays.

The proposed cavity-backed slot antenna exhibits a dual-resonant characteristic, and its operating bandwidth can be enhanced by increasing the slot WLR. Fig. 2 shows the simulated return loss of the antennas with the WLRs of 0.2, 0.4, 0.6 and 0.71, respectively.

A cavity-backed coplanar waveguide slot antenna array

The basic cavity-backed slot antenna is shown in Figure 1 (in a rectangular cube of size $A \times B \times C$). The walls are metallic (electrically conducting), and the inside is hollow. On one end, a slot is cut into the wall. The cavity is typically excited by a probe antenna in the interior of the cavity, which typically is modeled as a monopole antenna.
