Human Genome Project 1990–2003. The Human Genome Project (HGP) was an international 13-year effort, 1990 to 2003. Primary goals were to discover the complete set of human genes and make them accessible for further biological study, and determine the complete sequence of DNA bases in the human genome. See Timeline for more HGP history.

Human Gene Mapping The human genome is distributed among 24 chromosomes (22 autosomes and the 2 sex chromosomes), each containing between 5×10^4 and 26×10^4 kb of DNA (Figure 4.26). The first stage of human gene mapping is the assignment of known genes to a chromosomal locus, usually defined as a metaphase chromosome band.

Human genome - Wikipedia

Chromosomes are structures within cells that contain a person's genes. A chromosome contains hundreds to thousands of genes. A trait is any gene-determined characteristic and is often determined by more than one gene. Proteins are probably the most important class of material in the body.

Lists of human genes - Wikipedia

Chromosomes are made of DNA, and genes are special units of chromosomal DNA. Each chromosome is a very long molecule, so it needs to be wrapped tightly around proteins for efficient packaging. Near the center of each chromosome is its centromere, a narrow region that divides the chromosome into a long arm (q) and a short arm (p).

What is a gene? - Genetics Home Reference - NIH

Human beings have 22 chromosome pairs and a pair of sex chromosomes. Apart from genes, the chromosomes also contain regulatory elements and nucleotide sequences. They house DNA-bound proteins which control functions of the DNA. Interestingly, the word 'chromosome' originated from the Greek word, *chromē* meaning color.
