Everything You Need to Identify Rocks

All rocks except obsidian and coal are made of minerals. (Obsidian is a volcanic rock made of glass and coal is made of organic carbon.) Most rocks contain several minerals in a mixture characteristic of the particular rock type. When identifying a rock you must first identify the individual minerals that make up that rock.

Gem & Mineral Identification | Treasure Quest Mining

Color is important, but by itself, color does not positively identify a mineral. The classic example is iron pyrite, which has a color that resembles gold so closely that people call it fool's gold. Color does help identify some rocks, such as the monochromatic azurite with its deep azure color, but many minerals have combinations or colors or hues caused by the presences of impurities.
