Monte Carlo simulations use probability distributions to model and visualize a forecast's full range of possible outcomes. This can be done on an aggregate level and for individual inputs, assumptions, and drivers. Monte Carlo methods are then used to calculate the probability distributions at an aggregate level.

The simplification and sparseness of data models are the functions where Lasso Regression does the best. In other words, the data models should have the optimum parameters for accurate outcomes. Principal Component Regression (PCR) The Principal Component Analysis has an application to the x variable, reducing the dimensionality of the data.

In mathematics, a time series is a series of data points indexed (or listed or graphed) in time order. Most commonly, a time series is a sequence taken at successive equally spaced points in time. Thus it is a sequence of discrete-time data. Examples of time series are heights of ocean tides, counts of sunspots, and the daily closing value of the Dow Jones Industrial Average.
