The engine coolant temperature (ECT) sensor is one of the most important engine management sensors. Consequently, its readings play a key role in calculations which affect engine performance. Consequently, its readings play a key role in calculations which affect engine performance.

ENGINE COOLANT TEMPERATURE SENSORS

The coolant temperature sensor, also known as the coolant temperature switch, is the engine management system that monitors the temperature of the coolant and relays this information to the ECM. When the sensor is functioning properly, it will tell your on board computer if the temperature is too high, alerting the driver that a problem exists by illuminating a warning light on the dashboard.

Engine Coolant Temperature (ECT) Sensor - Function ...

The temperature of the cooling air may range from well below freezing to 50 °C. Further, while engines in long-haul boat or rail service may operate at a steady load, road vehicles often see widely varying and quickly varying load. Thus, the cooling system is designed to vary cooling so the engine is neither too hot nor too cold.

What is a Coolant Temperature Sensor?

The coolant temperature sensor, also known as the coolant temperature switch, is an engine management system sensor that is used to monitor the temperature of the engine's coolant. Most coolant temperature sensors operate using electrical resistance to measure the temperature of the coolant.
