Public-key cryptography, or asymmetric cryptography, is a cryptographic system that uses pairs of keys.Each pair consists of a public key (which may be known to others) and a private key (which may not be known by anyone except the owner). The generation of such key pairs depends on cryptographic algorithms which are based on mathematical problems termed one-way functions.

quantum. Hence, an efficient solution to the learning problem implies a quantum algorithm for GAPSVP and SVP. A main open question is whether this reduction can be made classical (i.e., non-quantum). We also present a (classical) public-key cryptosystem whose security is based on the hardness of the learning problem.
