For the design of foundations, building codes should be consulted along with local codes to determine appropriate frost depths and design requirements. Foundation choice is dependent on many factors, such as soil type, site, climate and the process of choosing your foundation system goes beyond the scope of this article.

Foundation components are the brake-assembly components at the wheels of a vehicle, named for forming the basis of the rest of the brake system. These mechanical parts contained around the wheels are controlled by the air brake system. The three types of foundation brake systems are "S" cam brakes, disc brakes and wedge brakes.
