linear algebra is to take linear combinations of column vectors. This is exactly the result of a matrix-vector multiplication. Ax is a combination of the columns of A . When we take all combinations Ax of the column vectors, we get the column space. If this space includes the vector b , we can solve the equation $Ax = b$.

Those were named the Four Fundamental Subspaces in my first book, and they start from a matrix A . Each row of A is a vector in n -dimensional space. When the matrix has m rows, each column is a vector in m -dimensional space. The crucial operation in linear algebra is to take linear combinations of column vectors.
