At JuliaCon 2017, our very own Mike Innes gives a brief introduction to Flux.jl, a Julia package that expands Julia's flexibility in machine learning use cases. He further goes on to show how it provides lightweight abstractions on top of Julia's native GPU and Automatic Differentiation support, while remaining fully hackable.

4.2.1 Client/Server Systems. The client-server architecture is a way to dispense a service from a central source. There is a single server that provides a service, and multiple clients that communicate with the server to consume its products. In this architecture, clients and servers have different jobs.

Distributed computing - Wikipedia

General-purpose computing on graphics processing units (GPGPU, rarely GPGP) is the use of a graphics processing unit (GPU), which typically handles computation only for computer graphics, to perform computation in applications traditionally handled by the central processing unit (CPU). The use of multiple video cards in one computer, or large numbers of graphics chips, further parallelizes the ...

Introduction to Parallel Computing

For parallel programming in C++, we use a library, called PASL, that we have been developing over the past 5 years. The implementation of the library uses advanced scheduling techniques to run parallel programs efficiently on modern multicores and provides a range of utilities for understanding the behavior of parallel programs.

An Introduction to Parallel Computing in C++

Distributed systems are groups of networked computers which share a common goal for their work. The terms "concurrent computing", "parallel computing", and "distributed computing" have a lot of overlap, and no clear distinction exists between them. The same system may be characterized both as "parallel" and "distributed"; the processors in a typical distributed system run concurrently in parallel.
