Chemical Bonds: Covalent vs. Ionic

Covalent and ionic bonding is often taught as being black or white, like these forms of bonding are two sides of the same coin. This is not an accurate way of representing chemical bonds. A more realistic approach is based on the electronegativity of the two atoms and involves considering a spectrum starting at a 100% covalent bond and ending at a 100% ionic bond.

Review Ionic and Covalent Compounds - Elmhurst College Covalent Bonds. Covalent bonds form when atoms share electrons. Hydrogen is a first shell element with only one valence electron, so it can only form one bond creating a duet, an exception to the octet rule. With its four valence electrons, carbon can form four bonds to create an octet. Normally two electrons pairs up and forms a bond, e.g ...

Review for Quiz 2: Ionic and Covalent Compounds

An ionic bond essentially donates an electron to the other atom participating in the bond, while electrons in a covalent bond are shared equally between the atoms. The only pure covalent bonds occur between identical atoms. Usually, there is some polarity (polar covalent bond) in which the electrons are shared, but spend more time with one atom than the other. Ionic bonds form between a metal and a nonmetal. Covalent bonds form between two nonmetals.

Review - Covalent Bonding - ScienceGeek.net

Covalent bonds are awesome, because they allow for a vast variety of compounds, much more than ionic bonds. Because of covalent bonding we have things like water (H₂O), carbon dioxide (CO₂), the kind of alcohol that people drink (C₂H₅OH), and even larger compounds like aspirin, estrogen, and testosterone.
