In the present thesis our objective is to study the results obtained by various authors concerning, derivations, semiderivation, (α, β) -derivation, Jordan (α, β) -derivations, left derivation, Jordan derivation and generalized Jordan derivations of prime and semiprime rings.

The purpose of this paper is to study derivations satisfying certain differential identities on Jordan ideals of prime rings. Some well known results characterizing commutativity of prime rings by derivations have been generalized by using Jordan ideals. Moreover, we provide examples to show that our results cannot be extended to semi-prime rings.

In [4], Herstein showed that every Jordan derivation on a 2-torsion free prime ring is a derivation. In [3], Awtar extended this result on Lie ideals. In [1], M. Ashraf and N. Rehman showed that if R is a ring with a commutator which is not a divisor of zero, then every Jordan generalized derivation on R is a generalized derivation.

We define a notion of generalized Jordan (resp. Lie) derivations and give some elementary properties of generalized Jordan (resp. Lie) derivations. These categorical results correspond to the results of generalized derivations in [N]. Moreover, we extend Herstein's result of Jordan derivations on a prime ring to generalized Jordan derivations.

Let R be a 2-torsion free prime ring and J a nonzero Jordan ideal of R . If R admits a generalized derivation F associated with a nonzero derivation d satisfying $F(xy) + xy \in Z(R)$ for all $x, y \in J$, then R is commutative. JORDAN DERIVATIONS OF PRIME RINGS I. N. HERSTEIN 1. Given any associative ring A one can construct from its operations and elements a new ring, the Jordan ring of A , by defining the product in this ring to be $a \circ b = ab + ba$ for all $a, b \in A$, where the product ab signifies the product of a and b in the associative ring A
