This method of proof is also known by its Latin name, modus ponens (literally, “method of affirming”—roughly, having affirmed the antecedent of a conditional, you may affirm the consequent). From P and $P \rightarrow Q$, you may infer Q .

If it is not, give example sentences that show how the conclusion can be false though the premises are true. (a) From P and $\neg Q$, infer $P \wedge Q$. This is invalid, as the following sentences exemplify: 1 P = Logic is fun. True 2 $\neg Q$ = Logic is not easy. True 3 $P \wedge Q$ = Logic is fun and easy.

the main proof) leads to the same conclusion, then you may derive

that conclusion from the disjunction (together with any main premises cited within the subproofs). This is clearly a formal version of the method of proof by cases. Each of the P_i represents one of the cases. Each subproof represents a demonstration that, in each case,

We adopt a formal language for making statements, since natural languages (like English, for example) are far too vague and ambiguous for us to analyze sufficiently. Armed with the formal language, we will be able to model the notions of truth, proof and consequence, among others. While logic is technical in nature, the key concepts in the course will be developed by considering natural English statements, and we will focus the relationships between such statements and their FOL counterparts.
