We have built a series of legged robots for experiments on active balance in dynamic legged locomotion. Taken collectively, these robots have traversed simple paths, run with several different gaits (hop, run, trot, pace, bound), run fast (13 mph), jumped over obstacles, controlled step length, climbed a simplified stairway, walked over ramps, and performed rudimentary

Scientific American
spotlights how MIT
researchers have developed a
new control method that
enables a two-legged human-
controlled robot to maintain
its balance while responding
quickly to the operator's
movements. The robot, which
is dubbed Little HERMES,
"combines the strength and
resilience of a robot with
the knowledge and
adaptability of a human."
