New Amorphous theoretical model The «New Amorphous» dispersion formula was derived by Horiba Jobin Yvon on the basis of Forouhi-Bloomer formulation. This new formulation was established in order to give a Lorentzian shape to the expressions of the extinction coefficient and refractive index. The absorption coefficient is given by :

The combination of the Lorentz-Lorentz formula with the Lorentz model of dielectric dispersion results in a decrease in the effective resonance frequency of the material when the number density of Lorentz oscillators is large. An equivalence relation is derived that equates the frequency dispersion of the Lorentz model alone with that modified by the Lorentz-Lorentz formula.

Classical Dispersion Model - horiba.com

The model uses mathematical relations called dispersion formulas that help to evaluate the material's optical properties by adjusting specific fit parameters. This technical note deals with the Drude dispersion formula. Note that the technical notes «Classical dispersion model» and «Lorentz dispersion model» are complementary to this one.

The model was extended in 1905 by Hendrik Antoon Lorentz (and hence is also known as the Drude–Lorentz model) [citation needed] and is a classical model. Later it was supplemented with the results of quantum theory in 1933 by Arnold Sommerfeld and Hans Bethe, leading to the Drude–Sommerfeld model

New Amorphous Dispersion Formula - Horiba

The Lorentz oscillator is a prototype to model many absorbing materials. A visually transparent material may be understood as Lorentz oscillators in the UV. One then sees the tail of the Lorentz dispersion function which looks like a Cauchy dispersion. To model the true situation, however, some refinements are necessary.

Lorentz was a late nineteenth century physicist, and quantum mechanics had not yet been discovered. However, he did understand the results of classical mechanics and electromagnetic theory. Therefore, he described the problem of atom-field interactions in these terms. Lorentz thought of an atom as a mass (the nucleus) connected to another
