patients with early-stage epidermal growth factor receptor-mutated (EGFRm) non-small cell lung cancer (NSCLC), after complete tumor resection.

AstraZeneca neoadjuvant lung cancer study may not be approved

A study of an AstraZeneca lung cancer treatment was recently stopped two years early because independent trial advisors concluded the drug, called Tagrisso, had already clearly shown a benefit over placebo. On Thursday, doctors get to see why. Results show Tagrisso reduced the risk of disease progression following surgery by 80%, a result the lead study investigator called a "home run."

Lung Cancer Astrazeneca

Lung cancer is the most common form of cancer worldwide, with approximately 2 million cases diagnosed and 1.8 million deaths every year. 1 Only 16% of patients are diagnosed when the tumour is still localised to the lung and for those patients diagnosed at a later stage, the prognosis is especially poor. 2 As such, AstraZeneca is prioritising lung cancer research to address the
