The mass transfer concepts and equations used herein are covered thoroughly in various mass transfer textbooks, including Treybal [1] and Henley and Seader [2]. These texts also describe the McCabe-Thiele [3] binary distillation diagram, which illustrates distillation stages and equilibrium driving forces.

The mass transfer coefficients for CO₂ in 3 M aqueous NH₃ alone are 3–5 times lower than those in MEA solutions in the CO₂ loading range of 0.2 to 0.4 mol/mol. The low values for the mass transfer coefficients are primarily due to the low rate constant for the reaction of NH₃ and CO₂ in comparison with that for the reaction between MEA ...

Liquid-liquid (or solvent) extraction is a countercurrent separation process for isolating the constituents of a liquid mixture. In its simplest form, this involves the extraction of a solute from a binary solution by bringing it into contact with a second immiscible solvent in which the solute is soluble.
