...

*Malignant mesothelioma (MM)  
is an aggressive neoplasm  
that arises primarily from  
the surface serosal cells of  
the pleura and peritoneum (1,  
2). It can also develop from  
the serosal surfaces of the  
pericardium or the tunica  
vaginalis. Up to 80% of all  
cases are pleural in origin and  
are defined as malignant  
pleural mesothelioma (MPM).*

Therapies

is a solid, locally aggressive tumor of the pleura that encases and invades the lung parenchyma in late stages of the disease (see figure figure1) causing clinically significant morbidities such as dyspnea and chest pain [1,2]. Without treatment, MPM is associated with a poor median survival, ranging from 4 to 12 months [].
