You can search Google Books for any book or topic. In this case, let's go with "Alice in Wonderland" since it's a well-known book, and there's probably a free eBook or two for this title. The original work is in the public domain, so most of the variations are just with formatting and the number of illustrations included in the work. However, you might also run into several copies for sale, as reformatting the print copy into an eBook still took some work. Some of your search results may also be related works with the same title.

Maven coordinates identify uniquely a project, a dependency, or a plugin defined in POM. Each entity is uniquely identified by the combination of a group identifier, an artifact identifier, and the version (and, of course, with the packaging and the classifier). The group identifier is a way of grouping different Maven artifacts.

Maven runs as a Java process on JVM. As Java proceeds with a build, it keeps on creating Java objects. These objects are stored in the memory allocated to Maven. This area of memory where Java objects are stored is known as heap. Heap is created at the JVM start, and it increases as more and more objects are created up to the defined maximum limit.
