A zero vector is a vector with all elements equal to zero. Sometimes the zero vector of size  $n$  is written as  $0_n$ , where the subscript denotes the size. But usually a zero vector is denoted just  $0$ , the same symbol used to denote the number  $0$ . In this case you have to figure out the size of the zero vector from the context.

use of it popularized the method. Because this elimination technique is fundamental, we begin the study of our subject by learning how to apply this method in order to compute solutions for linear equations. After the computational aspects have been mastered, we will turn to the more theoretical facets surrounding linear systems. 1
