### Chapter 1. Introduction of Electrochemical Concepts

Electrochemical cells allow measurement and control of a redox reaction. The reaction can be started and stopped by connecting or disconnecting the two electrodes. If we place a variable resistance in the circuit, we can even control the rate of the net cell reaction by simply turning a knob.

We use two different half cells to measure how readily electrons can flow from one electrode to another, and the device used for measurement is called a voltmeter. The voltmeter measures the cell potential, denoted by  $E_{cell}$  (in units of Volts,  $1V=1J/C$ ), which is the potential difference between two half cells.

measure  $I_{corr}$ , we could use it to calculate the corrosion rate of the metal. Unfortunately,  $I_{corr}$  cannot be measured directly. However, it can be estimated using electrochemical techniques. In any real system,  $I_{corr}$  and Corrosion Rate are a function of many system variables including type of metal, solution composition,

So with an electrochemical cell, we can get a chemical reaction to move in both the spontaneous and the non-spontaneous direction. You are all familiar with this concept but you might not have thought about it as chemistry. When you are using a battery you are running a voltaic electrochemical cell in the spontaneous direction.
