A star with a planet will move in its own small orbit in response to the planet's gravity. This leads to variations in the speed with which the star moves toward or away from Earth, i.e. the variations are in the radial velocity of the star with respect to Earth. The radial velocity can be deduced from the displacement in the parent star's spectral lines due to the Doppler effect.

If a saddle is too narrow, it will increase pressure exactly in spots where it shouldn't. Back in 2002, SQLab was the first saddle manufacturer to introduce a system to measure the distance between the sit bones and to calculate the optimal saddle width. As a result, all SQLab saddle models are available in up to four different widths.
