Damage by microbial toxins Flashcards | Quizlet

While, for many bacteria, there is a tangible benefit to producing toxins in that they directly contribute to their replication and transmission to new hosts [1, 2], there are several for which it is not clear how causing disease symptoms is of any selective advantage to the bacterium.

The toxin (1 ? 3)- β -D-glucan is a polymer of glucose in the cell walls of most fungi, plants, certain bacteria, and algae. 9 As an indicator of human fungal exposure in indoor environments, 10 it has been associated with atopic asthma and reduced lung function. 10, 11

Microbial toxins. Volume I. Bacterial protein toxins.

Microbial toxins are toxins produced by micro-organisms, including bacteria and fungi. Microbial toxins promote infection and disease by directly damaging host tissues and by disabling the immune system. Some bacterial toxins, such as Botulinum neurotoxins, are the most potent natural toxins known. However, microbial toxins also have important uses in medical science and research.

Bacterial toxins are diverse and widely distributed in all three forms of life (Bacteria, Archaea and Eukaryotes). Some of the unique characteristics include structural folding, sequence and functional combination of domains, targeting a cellular process to execute their function, and most importantly their flexibility and dynamics.

Endotoxin and (1?3)-?-D-Glucan Contamination in Electronic ...

Microbial toxins are useful as agents in studies on membrane structure, biochemical pathways, and cellular regulatory mechanisms. Since relatively few of these toxins are commercially available, investigators must prepare their own reagents. This book provides in a single source the methods for preparing specific microbial toxins and their assay.
