Variable Names - MATLAB & Simulink
Pub names are used to identify and differentiate traditional drinking establishments. Many pubs (public houses) are centuries old, and were named at a time when most of their customers were illiterate, but could recognise pub signs. The use of signage was not confined to drinking establishments. British pubs may be named after and depict anything from everyday (particularly agricultural ...

African Names - Behind the Name
Quoting an identifier makes it case-sensitive, whereas unquoted names are always folded to lower case (unlike the SQL standard where unquoted names are folded to upper case). For example, the identifiers FOO , foo , and "foo" are considered the same by PostgreSQL, but "Foo" and "FOO" are different from these three and each other.

Wheel of Names
example: *lee matches names which end with the sound lee _ is a wildcard that will match exactly one letter in the pronunciation. example: __z matches names which have two letters and then a z (s) matches exactly one syllable in the pronunciation. example: (s)(s)ra matches names which have two syllables and then the sound rah (c) matches a ...

python - Convert Bytes to Floating Point Numbers? - Stack ...
The interim powers of one thousand between vigintillion and centillion do not have standardized names, nor do any higher powers, but there are many ad hoc extensions in use. The highest number listed in Robert Munafò's table of such unofficial names [2] is milli-millillion, which was coined as a name for 10 to the 3,000,003rd power.

How to Separate First Names and Last Names Into Separate ...
@PetrKrampl accuracy of C float (single, 4 bytes) and C double (double, 8 bytes). Python float is really C double. Whatever the accuracy of storing 3.141592654 as a C double, it's lost when it's converted to a C float (by struct.pack) and then back to C double (Python extracts the 4-bytes as a C float and then converts the result back to a C double/Python float).
