In engineering: a) usually on or near the earth's surface b) the earth's mass and radius are usually very large compared with those of the object under consideration. hence equation (1) becomes  $2. M F mK R (2)$  where: m mass of the object (kg) M is the mass of the earth (kg) R the radius of the earth (m) defining  $2. KM g R$

As we know that in mechanics of deformable solids, externally applied forces acts on a body and body suffers a deformation. From equilibrium point of view, this action should be opposed or reacted by internal forces which are set up within the particles of material due to cohesion. These internal forces give rise to a concept of stress.

(a) You have to design a car, which can run at a speed of 140 km/hr on an expressway. In order to do this, you have to find engine power and the forces acting on the car body. Forces will come due to wind resistance, rolling resistance and inertia.

Mechanics It is defined as that branch of science, which describes and predicts the conditions of rest or motion of bodies under the action of forces. Engineering mechanics applies the principle of mechanics to design, taking into account the effects of forces. Statics Statics deal with the condition of equilibrium of bodies acted upon by forces.
