Trefethen and Bau is an exception to that rule. Indeed, the field of numerical linear algebra is unusual in having available several top-notch textbooks: Golub and Van Loan, Stewart's two volumes, Saad's books on iterative methods, Demmel's introduction, Watkins' undergraduate level treatment, and T&B.

I will specify the problem sets each week, and collect the solutions one week later. The assignments will have both theoretical and computational questions. The preferred language of this class (and of numerical linear algebra, in general) is MATLAB[®]. Homework will be graded, and will represent 50% of your final grade.

In addition to discussing established solution techniques, open problems will also be presented. The
course assumes familiarity with linear algebra and will involve a reasonable amount of programming in
MATLAB. During the second part of the course we will concentrate on numerical methods for solving
ordinary differential equations.

The main topics of Numerical Linear Algebra are the solution of different classes of eigenvalue problems
and linear systems. For the eigenvalue problem we discuss different classes. (a) The standard eigenvalue
problem: For a real or complex matrix $A \in \mathbb{C}^{n \times n}$, determine $\lambda \in \mathbb{C}$, $x \in \mathbb{C}^n$, such that $Ax = \lambda x$:
