### Analysis of Object Oriented Metrics

It is often difficult to determine which metric is more useful in which area. As a consequence, it is very difficult for project managers and practitioners to select measures for object-oriented systems. In this paper we investigate 22 metrics proposed by various researchers.

In 1994 Robert "Uncle Bob" Martin proposed a group of object-oriented metrics that are popular until now. Those metrics, unlike other object-oriented ones don't represent the full set of attributes to assess individual object-oriented design, they only focus on the relationship between packages in the project.

the proposed metrics are aimed at assessing the design of an object oriented system rather than its specific implementation, the potential benefits of this information can be substantially greater than metrics aimed at later phases in the life-cycle of an application. The Measure-Object cmdlet calculates the property values of certain types of object. Measure-Object performs three types of measurements, depending on the parameters in the command. The Measure-Object cmdlet performs calculations on the property values of objects. You can use Measure-Object to count objects or count objects with a specified Property.

There are system metrics that can be derived from class metrics with statistics, as relative measures, identifying systems that deviate from the norm. Unusual trends or characteristics of the system under construction can be spotted and corrected. The MOOD (Metrics for Object oriented Design) set of metrics of Abreu and [Abreu and

A Metrics Suite for Object Oriented Design

The object-oriented paradigm shows some peculiarities when compared with traditional software development. This is particularly apparent when one considers that object-oriented system development supports prototyping, and uses its own object-oriented programming languages and tools.
